Sacramento, CA 95825

Subject: Request for Revision and Recirculation of Draft EIR/EIS for Sites Reservoir Project

Dear Chairman Durst and Regional Director Conant:

The Humboldt County Board of Supervisors requests that the Draft Environmental Impact Statement/Environmental Impact Report (“Draft EIR/EIS”) for the Sites Reservoir Project be revised and recirculated prior to certification due to significant new information regarding the expected adverse environmental effects of the project’s proposed operations. After the comment period on the Draft EIR/EIS ended in 2017, serious deficiencies have been identified in the document warranting revision of the impacts analysis and new or modified alternatives and/or mitigation measures. Humboldt County has a vested interest in this project because significant impacts to the Trinity River, which is partially diverted into the Sacramento River, would cause irreversible harm to Humboldt County’s commercial, sport, and tribal fisheries.

Specifically, we are in receipt of the January 21, 2019 report by Kamman Engineering and Hydrology in which two significant impacts affecting the Trinity River were identified within the Sites Reservoir Project Draft EIR/EIS as follows:

1. The surface water modeling does not include an accounting of Humboldt County’s 1959 water contract with the Bureau of Reclamation for annual releases of not less than 50,000 acre-feet of Trinity River water, nor does it include the anticipated flow releases described in the Bureau of Reclamation’s Long-Term Plan to Protect Adult Salmon in the Lower Klamath River (2017 Record of Decision), and
2. The surface water modeling identifies a significant change in the pattern of Trinity River exports to the Sacramento River from fall to spring, thereby increasing residence time of water in Lewiston Reservoir and increasing Trinity River water temperatures. This change would likely violate North Coast Basin Plan Trinity River temperature objectives and SWRCB Water Right Order 90-05; however, the document fails to disclose the increased potential for temperature violations.

Issuing a final EIR/EIS without correcting these serious modeling problems will not meet the basic purpose and substantive legal requirement of the California Environmental Quality Act (“CEQA”) to prevent significant, avoidable damage to the environment by requiring changes in projects through the use of feasible alternatives or mitigation measures (CEQA Guidelines 15002). Moreover, failure to remodel the proposed action and alternatives in a recirculated Draft EIR/EIS

will not provide the public with an opportunity to review and comment on the actions, alternatives, and potential mitigation measures as required for transparency, and therefore it will not procedurally comply with CEQA Guidelines 15088.5.

An additional issue of concern that has potential adverse impacts on Humboldt County is your proposed minimum instream flows on the Sacramento River. In a letter dated January 12, 2018, to the Sites Project Authority, the California Department of Fish and Wildlife recommended a bypass flow requirement to maintain at least 13,000 cubic feet per second (cfs) past all diversion facilities, while you are proposing 3,250 cfs (Red Bluff), 4,000 CFS (Hamilton City), and 5,000 cfs (Wilkins Slough). This discrepancy greatly concerns us and we believe this issue requires at a minimum further analysis, and potentially revision of the selected alternative and mitigation measures, in a revised and recirculated Draft EIR/EIS.

The successful migration, spawning, and rearing of native wild Sacramento River salmon is critical to ensure the “harvestable surplus” of these stocks that is required for the success of Humboldt County commercial and sport fishing industries and our resource-dependent communities. If your project cannot be economically feasible without taking flows in the Sacramento River below state recommended **minimum** instream flows, we question the benefits to salmon and environmental neutrality that you have professed for your project. A revised and recirculated Draft EIR/EIS with a comparison of alternatives with various minimum instream flow volumes is required to adequately compare what it would mean to reduce the Sacramento River to such low flows.

We request a timely response from both the Sites Project Authority and the Bureau of Reclamation to the Humboldt County Board of Supervisors so we can take appropriate action to secure the public and private interests of our constituents on these important issues.

Sincerely,

Rex Bohn, Chairman  
Humboldt County Board of Supervisors
