1. Summary

The original wetland/upland delineation was performed on properties that surround Martin Slough in September and October, 2008. A new wetland/upland assessment was performed on January 25, 2017 upon request from RCAA to investigate a new area located west of Elk River Road and to confirm areas already delineated. Previous wetland delineations determined the extent of wetland-type vegetation (based on one-parameter) in areas that are within the Coastal Zone, and the extent of wetlands having wetland-type vegetation, hydric soils, and wetland hydrology (based on three-parameters) in areas not in the Coastal Zone. A total of 21 upland transect plots were delineated within the observed wetland area. Figures that present results of both the October 2008 investigation and the updated 2017 investigation are provided in Appendix A. Data sheets documenting conditions observed during both the 2008 and the 2017 investigations are included in Appendix B.

2. Introduction

The area of investigation consisted of evaluation of properties that surround Martin Slough in preparation for the Martin Slough Restoration Project, in Eureka, Humboldt County, California (Figure 1). The area of investigation included lands adjacent to Martin Slough for an approximate 1.5 miles stretch upstream from the existing tide gate at the convergence with Swain Slough. Swain Slough outlets to the Elk River approximately 0.5 miles downstream from Martin Slough. The Elk River then outlets to Humboldt Bay and subsequently to the Pacific Ocean. Properties evaluated included areas adjacent to Martin Slough, as indicated on Figure 2 (“2008 Investigation Boundary”) at the following locations:

1. Eureka Municipal Golf Course—portions of Assessor’s Parcel Numbers (APNs) 301-031-08 and -18 (Figures 3 through 5);
2. Portions of four agricultural properties owned by Mr. Gene Senestraro—APNs 301-211-06 & -07, 301-221-01, and 302-161-03 generally located west of the golf course, to the south of Herrick Street along the toe of Pine Hill, and east of Elk River Road (Figures 2 and 3); and,
3. Portions of three agricultural properties owned by Mr. Truman Vroman—APNs 305-021-08, -10 & -11 located adjacent to the south and east of the Senestraro properties and accessed from Elk River Road (Figures 2 and 3).
4. A new area west of Elk River Road that was recently identified as an area within the project needed by PG&E for construction staging (denoted in purple on Figures 2 and 5).

The Eureka Municipal Golf Course is generally located east of an area known as Pill Hill in south Eureka, California (Figure 1). F Street (runs north-south) is located to the north and east of the course, and then transitions into Fairway Drive, which is a zig-zag portion of road that connects from F Street through the course to Herrick Avenue to the west. Herrick Avenue runs east-west and connects to Highway 101. As indicated on the “Project Area Overview” map (Figure 1), the golf course consists of a northeast portion that surrounds the north branch and the main branch of Martin Slough near their convergence and contains the parking area and office west of F Street that straddles Fairway Drive (see Figure 4), and a southern portion that is located south of Fairway Drive (see Figure 3). The golf course extends to the southwest

adjacent to Martin Slough and terminates at the City of Eureka Limits; the southern edge of the golf course defines the extent of City jurisdiction. The Senestraro and Vroman agricultural properties are beyond the City Limits and are within Humboldt County jurisdiction (see Figures 1).

Portions of the area of investigation are within the Coastal Zone. The Coastal Zone includes the southwest corner of the City of Eureka Limits and the golf course, as well as the entire Vroman and Senestraro properties. The coastal zone map indicates that California Coastal Commission (CC) has primary jurisdiction over land within 100 feet of Martin Slough, and defines the area beyond 100 feet of the slough as being the Appeal Zone for the CC with primary jurisdiction falling to either the County of Humboldt or City of Eureka's Local Coastal Program (LCP), depending on the location (California Coastal Commission, 1986 and 1991).

3. Purpose

The purpose of this investigation was to determine the location of wetlands and uplands in areas adjacent to Martin Slough, in preparation for a restoration project within Martin Slough. The uplands/wetland delineation was performed in accordance with Army Corp of Engineers (USACE) wetlands criteria for areas outside the Coastal Zone and within the City of Eureka Limits (City jurisdiction and USACE oversight of delineation results). The uplands/wetland delineation was performed in accordance with CC criteria for areas within the primary or appeal zone of the California Coastal Commission "Coastal Zone" (with CC, City, or County primary jurisdiction depending on the area; requires CC and USACE oversight of delineation results).

4. Methodology

4.1 Wetland Delineation

The original wetlands delineation was conducted by a Winzler & Kelly (now GHD Inc.) field team consisting of a Soil Scientist and a Botanist. The wetland delineation was conducted over multiple days in September and October 2008, with a follow up visit on January 25, 2017 to investigate a new area west of Elk River Road and to reassess areas already delineated. To define a wetland, the USACE requires that all three parameters (vegetation, soil, and hydrology) show wetland attributes. The CC requires only one parameter to be present in order to define the site as a wetland.

The wetlands delineation followed the USACE criteria (three parameter approach) from the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys and Coast Region (USACE, 2010) within the north and eastern portions of the project area that have City of Eureka primary jurisdiction and are not in the Coastal Zone (City jurisdiction and USACE oversight of delineation results). The wetlands delineation conformed with CC one-parameter approach (relying on USACE manuals for reference and determination) in the western and southern portions of the project area that are within the Coastal Zone (City, County, or CC primary jurisdiction depending on the area; CC and USACE oversight of delineation results). Botany/soils/hydrology data sheets used are the current standard forms provided by the USACE for use (USACE, 2010).

Vegetation and soil data were collected at transects across the upland/wetland boundary with two plots (upland/wetland) per transect. Since a majority of the project acreage consisted of wetland conditions, the methodology focused on locating transects to delineate upland areas (denoted with purple hatching) within the larger wetland areas. Thus, transects are numbered to correlate with each documented upland area (for example for “Upland 1” at “transect #2”, upland pit = u1t2-U, wetland pit = u1t2-W, and the coordinating upland/wetland point where the transect intersects along the upland boundary line is numbered u1t2 on the maps). Intermediate plots were placed without collection of data sheets as appropriate (based on extrapolation from adjacent test pits and verification of soil conditions) and are indicated with an “-int” after the point number (i.e. u1t3-int) on data sheets. Additionally, due to the large project acreage, additional confirmation test pits were collected in some areas to confirm the wetland or upland conditions. The confirmation test pits do not consist of paired data sheets, do not necessarily correlate with a transect location, and are respectively individually labeled WP# (wetland pit, with identification number) or UP# (upland pit with identification number), or remain as unlabeled points on Figures (“Other Test Point”).

The horizontal location of each point along the upland/wetland boundary (location where each transect intersects the upland/wetland boundary) were collected using a handheld GPS Trimble unit (sub-meter accuracy). To relocate the actual test pit locations (uplands and wetlands), the distance from the upland/wetland boundary line was recorded on each data sheet. Due to the sub-meter accuracy of the GPS unit, it is more accurate to collect the actual distance while in the field and record on each individual data sheet under “remarks.” The location of the confirmation test pits (upland or wetland) were also collected using the GPS Trimble unit. The horizontal location of some site infrastructure features (such as bridges) that are visible on the aerial were collected to ensure that the base map lines up accurately with the delineation results. Other site infrastructure features of interest were recorded such as some noticeable pipe outlets/culverts within the slough.

4.2 Botanical Methodology

Vegetation data collection consisted of listing the species at each plot in each layer. All species within a radius of five feet were listed in the herb layer. Vegetation/Soils/Hydrology data sheets used are the current standard forms requested by the USACE for use (USACE, 2010). The species were then classified as to whether or not they are wetlands indicators, using the standard reference for plant wetlands indicators: *State of California 2016 Wetland Plant List* (Lichvar et al. 2016). The standard reference document classifies plants based on the probability that they would be found in wetlands, ranging from Obligate (almost always in wetlands) [OBL], Facultative/wet (67% to 99% in wetlands) [FACW], Facultative (34% to 66% in wetlands) [FAC], Facultative/up (1% to 33% in wetlands) [FACU], to Uplands (less than 1% in wetlands) [UP]. Plants not listed in the manual are considered to be in the upland category.

4.3 Soils Methodology

The Regional Supplement to the Corps of Engineers Wetland Delineation Manual (USACE, 2010) procedures were combined with the Natural Resources Conservation Service’s (NRCS) definition of hydric soils presented in Changes in Hydric Soils of the United States and Field Indicators of Hydric Soils in the United States (USDA/NRCS, 2016). Vegetation/Soils/Hydrology data sheets used are the current standard forms requested by the USACE for use (USACE, 2010). Data sheets are attached (Appendix B). Soil pits were dug to an approximate depth of 18 inches. Data on soil color, texture and redoximorphic features was collected. Care was taken to observe mottling (iron concentrations) and to distinguish between chromas of 1 and 2 that would indicate an iron-depleted soil within 12 inches of the soil surface (USACE, 2010; USDA/NRCS, 2016).

Colors were described for the entire depth of the test pit and colors were determined on moist ped surfaces, which had not been crushed, using the Munsell Color Chart (Gretag Macbeth, 2000). Soils with low chromas were verified as being hydric or upland with Field Indicators of Hydric Soils in the United States (Version 8.0, 2016) using indicators for a depleted matrix (F3) and/or redox dark surface (F6) soil conditions.

4.4 Hydrology Methodology

The delineation was performed during the fall of 2008 and winter of 2017. Direct evidence of ground water (soil saturation, standing water, etc.) was not present in most of the wetland plots during the 2008 delineation (except those installed directly within the banks of the active slough channel) but standing water and a high ground water table was observed in portions of the new 2017 delineation area west of Elk River Road. During the 2008 delineation, primary wetland hydrologic indicators were assumed to be present for the wet season based on presence of soil indicators and/or presence of dominant and strongly hydrophytic vegetation. Secondary indicators were evaluated as well, and documented in some locations, such as geomorphic position (D2), passing the “FAC-Neutral Test” (D5), drainage pattern (B10), etc.

There were several problematic areas identified during the 2008 delineation in areas that were not in the Coastal Zone but contained two wetland parameters (soil and vegetation). These areas were topographically elevated and dominated by facultative (FAC) vegetation (not strongly hydrophytic), yet exhibited redoximorphic soil conditions (due to grading and absence of topsoil). As a result, it is recommended that wet-weather observation of the actual water table be performed to assist in final determination of wetland or upland conditions using the 3 parameter approach. These areas are denoted as a “Wet Season Investigation Area” in black hatched pattern indicated on Figures 2-5 and are discussed in Section 5.4.6 below.

4.5 Wetland Determination

The wetland boundary was evaluated using the USACE (three-parameter) or CC (one-parameter) methodologies, based on the location in relation to the Coastal Zone boundary. The wetland determination was made with an emphasis on redoximorphic soil features and the dominance of wetland vegetation. Wetland hydrology was either assumed to be present or secondary indicators were relied upon (as described above for 2008). Primary hydrologic indicators were observed in 2017. For locations not in the Coastal Zone (City primary jurisdiction, USACE oversight of delineation results), an area was determined to be a wetland when soil, vegetation, and hydrology met the three-parameter approach. In areas outside of the Coastal Zone, an area was determined to be uplands based on absence of any one wetland indicator (soils/botany/hydrology) based on the three-parameter approach. Within the Coastal Zone (City, County, or CC primary jurisdiction and CC and USACE oversight on delineation results), areas where the existence of any one indicator were present were identified. Within the Coastal Zone, an area was determined to be uplands based on absence of all three wetland indicators (soils/botany/hydrology) based on the one-parameter approach. All wetland plots exhibited a predominance of facultative (FAC) or wetter vegetation and most upland plots within the Coastal Zone exhibited a predominance of facultative-up (FACU) or drier vegetation.

Once wetland characteristics were determined for each transect, the horizontal location of the upland/wetland boundary were recorded using a handheld Trimble GPS unit with sub-meter accuracy.

5. Results

5.1 Existing Site Information

The soils survey map for the Martin Slough project area indicates that Bayside 3 (Ba3) and Bayside 4 (Ba4) wetland soils (silty clay loam, imperfectly drained, 0-3% slopes) exist throughout the southern portions of the project area (McLaughlin, 1965). The Bayside Series generally consists of floodplain loam soils described as “originally vegetated with oak, alder, willow, spruce, and in farthest reaches redwood.” More specifically, these areas consist of flood plain and diked tidal lands described as originally vegetated in “stream basin with willow, spruce, and rush” and in “tidal reaches with pickleweed, silverweed, and rush.” The golf course lands are mapped as residential/business/industrial areas (UI) and the soils are thus unclassified. The U.S. Fish and Wildlife wetlands inventory generally identifies multiple types of wetland habitats within the project area as follows: “Riverine, lower perennial, unconsolidated bottom, permanently flooded (and portions with excavated channel),” “Riverine, upper perennial, unconsolidated bottom, permanently flooded,” “Palustrine, emergent, persistent, seasonally flooded (partially drained/ditched),” “Temporary flooded (partially drained/ditched),” and “Palustrine unconsolidated bottom permanently flooded” (U.S. Fish and Wildlife Service, 1987). Conditions appeared to be generally consistent with what was expected based on review of the soil survey and wetland inventory results. The above site information was not confirmed during the delineation field work due to the scope of the delineation that focused on identifying USACE and/or CC wetlands; therefore, this background information is provided here for reference purposes only.

5.2 Delineation Results

The parameters used to identify a wetland are characteristics of the soil, hydrology, and vegetation. To define a wetland, the USACE (2010) requires that all three parameters show wetland attributes. The CC defines a wetland based on the presence of any one parameter. A single wetland boundary line that satisfies both the USACE and CC methodologies was mapped for project areas within the Coastal Zone. The areas mapped that are not within the Coastal Zone comply with the USACE wetland definition. The area of investigation was determined to consist of one wetland that in many locations extends to the limits of the “2008 Investigation Boundary”. During the original 2008 delineation effort it was originally thought that there were a total of two wetland areas, but these areas were determined to be connected, therefore data sheets are labeled as Wetland 2 (W2T#), while there is only one continuous wetland present within the project area. A total of 21 upland transects were delineated within the observed wetland area. Figures 4 – 4 in Appendix A show the results of the 2008 and 2017 wetland delineations. Results of analysis of the three wetland parameters (vegetation, soils and hydrology) are summarized below.

Hydrophytic vegetation was dominant within the wetland area (Data Sheets in Appendix B). The wetlands investigation determined that Estuarine and Palustrine Emergent, Palustrine Shrub-Scrub occur at the site, classified per Classification of Wetlands and Deepwater Habitats of the United States (FWS, 1979). Typical vegetation associated with the wetlands included the following OBL, FACW, or FAC designated indicator species (Lichvar et al. 2016).

- Pacific water parsley (*Oenanthe sarmentosa*) [OBL]
- Reed canary grass (*Phalaris arundinaceae*) [FACW, formerly OBL]
- Pacific silver-weed (*Potentilla anserina*) [OBL]
- Broadfruit bur-reed (*Sparganium eurycarpum*) [OBL]

- Field horsetail (*Equisetum arvense*) [FAC]
- Small-headed bulrush (*Scirpus microcarpus*) [OBL, formerly FACW]

Dominant vegetation within the fairway of the golf course adjacent to the slough consisted of tall fescue (*Festuca arundinacea*, synonym: *Schedonorus arundinaceus*) [FAC], annual bluegrass (*Poa annua*) [FAC, formerly FACW], perennial ryegrass (*Lolium perenne*, now *Festuca perennis*) [FAC], as well as colonial bentgrass (*Agrostis capillaris*) [FAC]. In some cases, the area was determined to be wetland depending on species composition at each site and in conjunction with evaluation of soil characteristics. In some cases, FAC or wetter vegetation was dominant in upland plots, but no presence of wetland soil parameter(s) were evident; all delineated upland areas were confirmed by upland soils (Appendix B).

Although not strongly hydrophytic, vegetation such as tall fescue (*Festuca arundinacea*), perennial ryegrass (*Lolium perenne*), annual bluegrass (*Poa annua*), bird's foot trefoil (*Lotus corniculatus*) [FAC], colonial bentgrass (*Agrostis capillaries*), velvet grass (*Holcus lanatus*) [FAC], buttercup (*Ranunculus repens*) [FAC, formerly FACW], and English plantain (*Plantago lanceolata*) [FACU, formerly FAC] were commonly found in both wetland and upland areas (where confirmed to be uplands based on lack of primary or secondary wetland groundwater parameters within the delineation area). All these aforementioned species are FACW or FAC designated indicator species (Lichvar et al. 2016).

Upland vegetation such as Kentucky bluegrass (*Poa pratensis*) [FAC, formerly FACU], cow parsnip (*Heracleum lanatum*, now *H. maximum*) [FAC, formerly FACU], white clover (*Trifolium repens*) [FAC, formerly FACU], soft brome (*Bromus hordeaceus*) [FACU], hairy cat's ear (*Hypochaeris radicata*) [FACU], orchard grass (*Dactylis glomerata*) [FACU], and sweet vernal grass (*Anthoxanthum odoratum*) [FACU] were dominant in many upland locations.

Soils in delineated areas were predominantly loam to silty loam in texture at surface with loam to clay loam or clay in subsoil. Wetland soils exhibited redoximorphic features typically found in hydric soils. These features included low chromas with redoximorphic (iron concentrations) at or above 10 inches from the soil surface and/or gleyed soil matrix color (5GY 4/1). Representative wetland (hydric) soils had matrix color ranges of 10YR 3/2, 10YR 4/2, 5Y 4/1, and 5G 4/1. Several wetland matrix colors were documented to be 10YR 3/3 in conjunction with redoximorphic features; this condition is typically not considered to meet wetland soil indicator(s) due to absence of low matrix chroma (2 or less), but coupled with prominent redoximorphic conditions and in some cases location within the slough channel, it was the determination of the field scientists that this was an unusual condition and the area was determined to be a wetland. Iron concentrations were documented in some wetland plots within 10 inches of the surface, with representative color ranges of 10YR 3/4, 10YR 3/6, 10YR 4/3, 10YR 5/6. The new 2017 PG&E staging area wetland soils had a matrix color of 2.5Y 3/2 with redoximorphic features with the color or 7.5YR 3/4 (Appendix B).

Representative upland soils had surface and subsurface color ranges of 10YR 3/2, 2.5Y 4/2, 2.5Y 4/3, and 2.5Y 3/3 with no redoximorphic features within 10 inches of the surface. Upland soils with a color of 10YR 3/1 were due to high organic matter (found on grassy slopes above the agricultural lands) and low chromas are not likely due to reducing conditions, but organic matter staining (Appendix B).

5.3 Ordinary High Water

The Ordinary High Water (OHW) was mapped to designate the active (tidally influenced) slough channel, based on evaluation of top of bank, characteristics of the vegetation, and signs of scouring. Point data was collected in 2008, which has been merged to show only the approximate boundary line of the OHW (Figures 2 through 4).

5.4 Upland Areas

A total of 21 upland transects were identified, many of these areas are very small in size but were mapped for informational purposes. Larger upland areas were investigated to document possible areas to reuse excavated soil from proposed slough restoration activities, and thus square footage of these larger areas can be made available during the planning phase. The more significant (larger) upland features are described below.

5.4.1 Upland Transects 1, 2, 3, and 16

These areas are long thin uplands that run linear/adjacent to the active slough channel (Figures 3 and 4) and are likely historically formed from side-casting from slough maintenance activities and/or overbank deposits.

- Upland Transect 1, see U1T3 data point
- Upland Transect 2, intermediate data points only
- Upland Transect 3, see U3T32 data points
- Upland Transect 16, intermediate data points only

5.4.2 Upland Transects 4, 7, 8, 9, 11, and 13

These areas are very small (each smaller than 15 square feet) and are associated with footings and access for several bridges that cross the slough and provide access for golf carts to the various portions of the course. Upland Transect 13 is slightly larger as it is associated with the bridge footing for Fairway Drive (Figure 4).

5.4.3 Upland Transects 5, 6, 15, 18, and 19

These areas are elevated and have documented historic site alterations such as cutting, stockpiling, and storage of vegetation/debris (Figures 2 through 4, Photo 1 in Appendix C). These areas are identified as uplands based on soils and/or vegetation.

- Upland Transect 5, documented by upland pit UP5
- Upland Transect 6, documented by upland pit UP6
- Upland Transect 15, documented by UP15T1
- Upland Transect 18, located on agricultural land in the Coastal Zone, see U18T1
- Upland Transect 19, located on agricultural lands in the Coastal Zone, see U18T1

5.4.4 Uplands Transects 10, 12, 14, 17, 20, 21

Several wetland areas are formed due to natural and/or altered (cut) areas that are topographically elevated above the slough (Figures 2 through 4 in Appendix A). These areas were confirmed to be upland based on absence of wetland soils and/or vegetation.

- Upland Transects 10 and 12 are located along the toe of slope at the northeast edge of the golf course
- Upland Transect 14 surrounds a maintenance shed
- Upland Transects 17 and 20 are located upslope from a slough finger that extends to the south of the southern edge of the golf course

- Upland Transect 21 is similarly elevated above the slough, upslope from agricultural lands at the southern extent of the project area.

5.4.5 Riparian

A riparian area that is associated with USFWS regulated waters was mapped for informational purposes based on the average drip line of canopy (Figure 4).

5.4.6 Topographically High Areas / Wet Season Investigation Areas

Several areas that are topographically higher than the slough channel (for example the driving range) were expected to have upland conditions due to elevation but delineation results in 2008, as well as investigations in 2017, show presence of redoximorphic soil features at or near the surface as well as facultative or unidentifiable vegetation (areas indicated with hatched pattern in Figures 2 through 4). Upon further evaluation of surrounding hill slopes above these areas, it appears that these areas were graded down from original surface levels based on pedestalled trees, visible upslope scarp/cut area, personal communication with site operator, and/or absence of surficial O or A horizons. The current surficial redoximorphic soil conditions could possibly be remnant from the existence of these areas in deep subsoils and now are at the surface. An example photograph of this condition is provided in Appendix C. These areas are for the most part not in the Coastal Zone thus all three parameters would be required to designate them as a wetland (see Discussion below). Due to the late summer (September) implementation of the original 2008 delineation field work, observation of groundwater hydrologic conditions was not possible. Typically, secondary hydrologic parameters can be evaluated during dry-season delineations. However, secondary parameters were not evident in this heavily managed landscape. Thus, these areas would need to be further investigated in the wet-season (monitoring wells and/or observation points) to determine presence/absence of the hydrologic parameter. Due to the active use of these areas by the golf course, the Applicant indicated in 2008 these areas are not being considered for reuse of excess soil from the Martin Slough Enhancement project.

These Wet Season Investigation areas are denoted with black hatching on Figures 2 through 4. During the 2017 site visit a new small topographically higher area was added to the previously mapped area for wet season investigation outside of the Coastal Zone (Figure 3), thus it is unlikely that those Upland Investigation Areas on the East of the Coastal Zone boundary on Figure 3 and those on Figure 4 could be defined as wetlands based on a one-parameter approach. Complete evaluation and refinement of the boundaries during the 2017 investigation was outside of the scope of work but these areas were all investigated and determined to have been correctly mapped with the exception of one Upland Investigation Area that was removed and determined to be a wetland based on soil saturation, surficial hydrology, and excavation and testing of surface soils. This area was originally mapped to the west of upland transects 5 along the tree line.

5.4.7 Mixed Areas

Several areas were originally determined in 2008 to have a mixture (approximately 1:1 ratio) of upland and wetland conditions. The areas have hummocky micro-topography with highly variable conditions from one point to the next, thus mapping of upland/wetland boundaries within these small areas could be quite complex and impracticable given scope of this current project. These areas are in the Coastal Zone (in green on Figure 2) thus subject to the one-parameter approach for wetland determination and setbacks if deemed necessary. One such area is adjacent to Upland 21; represented by upland confirmation pit UP22 (in yellow). The other such area is indicated approximately 950 feet to the northeast. These areas would require further evaluation during the wet season to determine actual extent of wetlands/uplands,

therefore we have combined these areas into the category for “Wet Season Investigation Area” during the revision of this report in 2017.

5.4.8 Berm

The top (upland) portion of the berm varies from 6 to 12 feet wide. The berm has the appearance of wetland soil conditions, with dominant upland vegetation along the top of the berm and wetland vegetation along the side slopes. The actual determination of wetland / upland boundary along the berm would need to be verified during wet-weather conditions if this area is modified during the proposed Martin Slough Enhancement project. The berm was mapped for informational purposes only and should be considered only as an approximation.

6. Conclusions

The wetland delineations of September/October 2008 and January 2017, were performed on properties that surround Martin Slough. The wetland delineation determined the extent of wetland-type vegetation (based on one-parameter) in areas that are within the Coastal Zone, and the extent of wetlands having wetland-type vegetation, hydric soils, and wetland hydrology (based on three-parameters) in areas not in the Coastal Zone. The area of investigation was determined to consist of one wetland that in many locations extends to the limits of the “2008 Investigation Boundary”; a total of 21 upland transects were delineated within the 2008 wetland area and two test plots in the new 2017 PG&E project area were determined to indicate this new wetland area (Figure 4). The wetlands investigation determined that Estuarine Emergent wetlands and Palustrine Emergent and Palustrine Shrub-Scrub wetlands occur at the site.

One single upland/wetland line is shown for areas within the Coastal Zone that satisfies both the USACE (three-parameter) and CC (one-parameter) wetland definitions.

The areas of investigation are shown as “2008 Investigation Boundary” or as the staging area denoted as the “New PG&E Area Studied in 2017”. The wetland delineation results are provided in Figures 1 through 4. The field data sheets from the delineation area are included in Appendix B. And a photo of a pedestaled tree prior to land grading is provided in Appendix C.

7. Special Terms and Conditions

To achieve the delineation objectives stated in this report, conclusions of the delineation were based on the information available during the periods of the investigation, September/October 2008 and January 2017. Land use practices and regulations can change thereby affecting current conditions and delineation results; therefore, this delineation was originally given a 5-year expiration period and reinvestigated in 2017. This report was prepared for the exclusive use of Redwood Community Action Agency (RCAA). GHD Inc. is not liable for any action arising out of the reliance of any third party on the information contained within this report.

This report does not authorize any individuals to develop, fill or alter the wetlands delineated, or special or sensitive habitat(s) identified. Verification of the delineation by jurisdictional agencies is necessary prior to the use of this report for planning and development purposes. An agency stamped delineation map and jurisdictional approval letter is required to signify confirmation of delineation results. In situations where a field investigation determines that no jurisdictional wetlands occur, jurisdictional concurrence with these findings is recommended.

If filling is used under permitted authority (after agency review and written verification of said activities) care should be given to maintain sufficient quantity of fill to prevent a reestablishment of wetlands.

SOIL Martins Slough 9125108

LLW+KS Sampling Point: U1011-W

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

| Depth (inches) | Matrix | | Redox Features | | | | Texture | Remarks |
|-------------------|---------------|-----|----------------|-----|-------------------|--------------------------|---------|-----------------------------------|
| | Color (moist) | % | Color (moist) | % | Type ¹ | Loc ² | | |
| 0-15+ | 10YR3/2 | 90% | 10YR4/6 | 10% | C | M+PL (near surface only) | SIL | |
| 9-15+ | 10YR3/2 | 80% | 10YR4/6 | 20% | C | M | SIL | Redox features become much larger |

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix.²Location: PL=Pore Lining, RC=Root Channel, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Histosol (A1)
- Histic Epipedon (A2)
- Black Histic (A3)
- Hydrogen Sulfide (A4)
- Depleted Below Dark Surface (A11)
- Thick Dark Surface (A12)
- Sandy Mucky Mineral (S1)
- Sandy Gleyed Matrix (S4)
- Sandy Redox (S5)
- Stripped Matrix (S6)
- Loamy Mucky Mineral (F1) (except MLRA 1)
- Loamy Gleyed Matrix (F2)
- Depleted Matrix (F3)
- Redox Dark Surface (F6)
- Depleted Dark Surface (F7)
- Redox Depressions (F8)

Indicators for Problematic Hydric Soils³:

- 2 cm Muck (A10)
- Red Parent Material (TF2)
- Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: _____
Depth (inches): _____Hydric Soil Present? Yes No _____

Remarks:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- Surface Water (A1)
- High Water Table (A2)
- Saturation (A3)
- Water Marks (B1)
- Sediment Deposits (B2)
- Drift Deposits (B3)
- Algal Mat or Crust (B4)
- Iron Deposits (B5)
- Surface Soil Cracks (B6)
- Inundation Visible on Aerial Imagery (B7)

Secondary Indicators (2 or more required)

- Water-Stained Leaves (B9) (NW coast)
- Salt Crust (B11)
- Aquatic Invertebrates (B13)
- Hydrogen Sulfide Odor (C1)
- Oxidized Rhizospheres along Living Roots (C3)
- Presence of Reduced Iron (C4)
- Recent Iron Reduction in Plowed Soils (C6)
- Stunted or Stressed Plants (D1) (LRR A)
- Other (Explain in Remarks)
- Sparsely Vegetated Concave Surface (B8)
- Drainage Patterns (B10)
- Dry-Season Water Table (C2)
- Saturation Visible on Aerial Imagery (C9)
- Geomorphic Position (D2)
- Shallow Aquitard (D3)
- Frost-Heave Hummocks (D4)
- FAC-Neutral Test (D5)
- Raised Ant Mounds (D6) (LRR A)

Field Observations:

Surface Water Present? Yes _____ No Depth (inches): _____Water Table Present? Yes _____ No Depth (inches): _____Saturation Present? Yes _____ No Depth (inches): _____Wetland Hydrology Present? Yes No _____

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Pt ~ 10-ft from transect
 Hydrology assumed based on presence of redox + veg species.

| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix.²Location: PL=Pore Lining, RC=Root Channel, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- Histosol (A1)
- Histic Epipedon (A2)
- Black Histic (A3)
- Hydrogen Sulfide (A4)
- Depleted Below Dark Surface (A11)
- Thick Dark Surface (A12)
- Sandy Mucky Mineral (S1)
- Sandy Gleyed Matrix (S4)
- Sandy Redox (S5)
- Stripped Matrix (S6)
- Loamy Mucky Mineral (F1) (except MLRA 1)
- Loamy Gleyed Matrix (F2)
- Depleted Matrix (F3)
- Redox Dark Surface (F6)
- Depleted Dark Surface (F7)
- Redox Depressions (F8)

Indicators for Problematic Hydric Soils³:

- 2 cm Muck (A10)
- Red Parent Material (TF2)
- Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present.

Restrictive Layer (if present):

Type: _____

Depth (inches): _____

Hydric Soil Present? Yes No

Remarks:

Soil mixing - not redox, low chroma in surface
 is from organic matter, sub horizon
 no reduced chroma in matrix

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (any one indicator is sufficient)

- Surface Water (A1)
- High Water Table (A2)
- Saturation (A3)
- Water Marks (B1)
- Sediment Deposits (B2)
- Drift Deposits (B3)
- Algal Mat or Crust (B4)
- Iron Deposits (B5)
- Surface Soil Cracks (B6)
- Inundation Visible on Aerial Imagery (B7)
- Water-Stained Leaves (B9) (except NW coast)
- Salt Crust (B11)
- Aquatic Invertebrates (B13)
- Hydrogen Sulfide Odor (C1)
- Oxidized Rhizospheres along Living Roots (C3)
- Presence of Reduced Iron (C4)
- Recent Iron Reduction in Plowed Soils (C6)
- Stunted or Stressed Plants (D1) (LRR A)
- Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- Water-Stained Leaves (B9) (NW coast)
- Sparsely Vegetated Concave Surface (B8)
- Drainage Patterns (B10)
- Dry-Season Water Table (C2)
- Saturation Visible on Aerial Imagery (C9)
- Geomorphic Position (D2)
- Shallow Aquitard (D3)
- Frost-Heave Hummocks (D4)
- FAC-Neutral Test (D5)
- Raised Ant Mounds (D6) (LRR A)

Field Observations:

Surface Water Present? Yes No Depth (inches): _____Water Table Present? Yes No Depth (inches): _____Saturation Present? Yes No Depth (inches): _____Wetland Hydrology Present? Yes No

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

* Pit ~ 2-ft from transect.
