Subject: Hydrologic Isolation of Well WCR2017-006002 from Surface Waters
French Road, Near Bear Buttes, Miranda APN: 214-233-008

To Whom It May Concern:

As requested, Lindberg Geologic Consulting has assessed an existing permitted well on the above-referenced parcel to estimate its potential for hydrologic connectivity with any adjacent wetlands and or surface waters, and if pumping well WCR2017-006002 might affect nearby surface waters. The nearest watercourse in the vicinity of this well is Coon Creek, a perennial tributary of Hooker Creek (Figure 1). Hooker Creek in turn drains to the South Fork Eel River.

A California-Certified Engineering Geologist visited this site on September 29, 2022, to observe the subject well and local site conditions. Based on our research, observations, and our professional experience, it is our opinion the subject well has a low likelihood of being hydrologically connected to nearby surface waters in any manner that could affect adjacent springs, wetlands and or surface waters in the vicinity. We define the “vicinity” as the area within a 1,000-foot radius of the subject well (Figure 1), an area of approximately 72 acres. The proposed use of this well is to irrigate cannabis. We are not aware of the volume of water to be extracted or what the pumping schedule might be but expect that that information is provided elsewhere in the application.

Based on Humboldt County’s WebGIS and the Assessor’s Parcel Map (Figure 2), parcel 214-233-008 (Figure 2), encompasses approximately 126 acres. Our GPS located the subject well at latitude 40.1941° north, and longitude 123.81062° west ($\pm 9'$). This well is in Section 23, T3S, R3E, and is 135 feet deep. The wellhead is at an elevation of approximately 1,330 feet (Figure 1) and the elevation of the bottom of the well is therefore 1,195 feet.

The Humboldt County WebGIS shows two named streams within one mile of the well site. Coon Creek is more than 1,300 feet to the west, and Hooker Creek is one mile south of well -006002. One unnamed ephemeral tributary to the South Fork Eel River is more than 3,300 feet east of the subject well. The South Fork Eel River is less than 1.4 miles to the east and Butte Creek is approximately 1.5 miles west. Based on interpolation from the USGS “Miranda, Calif.” (1970), topographic quadrangle map (Figure 1), and the Humboldt County WebGIS, the well site elevation is 1,330 feet. The elevation of Coon Creek is 950 feet at the nearest point. The elevation of unnamed ephemeral tributary of the South Fork Eel River at its nearest point is approximately 1,240 feet. The elevation of Hooker Creek at its nearest point is approximately 1,120 feet.

Louis Peek, Well WCR2017-006002, Project No: 0492.00

Page 2

Elevation of the bottom of well -006002 is 1,195 feet, making the nearest watercourse, Coon Creek, 245 feet below the elevation of the bottom of the well.

Well location is shown approximately on the attached figures, and was drilled by Fisch Drilling, of Hydesville, in December 2017, under Humboldt County well permit #16/17-1272. Fisch Drilling is a licensed well-drilling contractor (C-57 #683865). Fisch Drilling submitted their attached well completion report (DWR 188) on December 13, 2017. The driller estimated a yield of 18 gpm on December 12, 2017, based on a 2-hour pump test. Drawdown, if any, during the pump test was not reported; contact the driller for further information.

Total drilled depth of this well is 135 feet with a borehole diameter of 10-inches from grade to total depth. From the surface to total depth, a 5.563-inch diameter blank (unslotted) PVC casing was installed. Per County requirements, a bentonite surface sanitary seal was installed from the surface to 20 feet. The driller did not report filling the annulus below the bentonite seal. The well is cased and sealed through any potential shallow subsurface aquifers in the uppermost 20 feet as required by county regulation. Depth to first water was not reported, but depth to static water in the completed developed well was reported to be 50 feet bgs when the driller conducted the pump test on December 12, 2017.

There are two springs mapped on the USGS topographic map within one mile of this well. The nearest mapped spring is more than 2,900 feet south, across the Bear Butte ridge in Section 23 at an elevation of approximately 1,550 feet. The next closest spring is more than 4,400 feet from the subject well, in the southeast quarter of Section 23, at an elevation of 1,440 feet, (Figure 1). There are no mapped springs within one mile of this well that are lower in elevation than the well -006002 at 1,330 feet.

This parcel is located within California's Coast Range Geomorphic Province, in the Central Belt of the Franciscan Complex (McLaughlin et al., 2000), a seismically active region in which large earthquakes are expected to occur during the economic life span (70 years) of any developments on the subject property. Geologic mapping by McLaughlin, shows that the site is underlain by Mélange (cm1) of the Central Belt of the Franciscan Complex, as shown in Figure 4.

According to the NRCS Web Soil Survey, the near-surface soils consist of loam to a depth of approximately 1-foot, paragravelly silty clay loam to 47 inches, and very paragravelly loam to 63 inches. Soils are interpreted to be uniformly distributed across that portion of the subject parcel with slopes less than 30 percent and underlain by the Central Belt mélange.

Materials reported on the geologic log of the driller's well completion report (attached) include 135 feet of "Franciscan Sandstone" from the ground surface to total depth. At the location of the subject well, the elevation of the first water-bearing aquifer unit was reportedly at a depth of 50 feet, an elevation of approximately 1,280 feet, based on the driller's report.

Page 3

Below the surface, the earth materials encountered in the boring appear to be Mélange of the Central Belt Franciscan Complex, as mapped by McLaughlin et al., (2000). Sheared, fractured, and folded metasedimentary rock materials can have variable hydraulic conductivity, but can also, under the right conditions, constitute significant aquifers. We interpret the sequence “Franciscan Formation” as described by the driller, to be within the Central Belt Mélange (cm2) of the Franciscan Complex. Sections of the profile apparently have favorable hydraulic conductivity, making them, in our interpretation, the primary water bearing unit(s) in this well.

A geologic cross section of the area after McLaughlin et al., (2000) shows the structural and stratigraphic relationships between the regional geologic units (Figure 5). The Central Belt Mélange is shown dipping east and bounded by thrust fault plane contacts. On-site, no dip of the rock units could be observed because they are mantled with soil and colluvium and obscured by vegetation. We interpret the faults in the subsurface to be hydrologic boundaries of reduced permeability (due to grinding and shearing along the fault planes), effectively separating units of the Franciscan from each other hydrologically, and limiting groundwater flow between the fault-bound units.

Based on observations, review of pertinent and available information, and our experience, it is our professional opinion that this well has a low potential of having any direct or significant connection to proximal surface waters. First water was unreported on the well completion report. Static water level was reported to be 50 feet bgs. This well is sealed through the upper 20 feet of any potential unconfined, near-surface aquifers with which it might communicate hydraulically through the borehole.

When considered with the stratigraphy, and the underlying geologic structure, plus the distances (horizontal and vertically) from the nearest surface waters, and the depth of the producing zone of this well (135 feet, elev. 1,195’), as well as the position of the well relative to the nearest surface waters in the vicinity, we conclude that the depth of the surface seal, and the fact this well was “developed from the bottom,” is sufficient to preclude the potential for hydraulic connectivity with perennial surface waters, of which there are none closer than 1,300 feet in Coon Creek at an elevation of 950 feet. Thus, the water source from which this well draws appears to be a subsurface aquifer not demonstrably connected to any surface waters or unconfined, near-surface aquifer(s). This well appears, in our professional opinion, likely to be hydraulically isolated from nearby wells, surface waters, springs or wetlands.

According to the driller, the estimated yield of this well was 18 gallons per minute (gpm) on December 12, 2017. Drawdown, if any, was not reported by Fisch after a two-hour air-lift pump test. At 18 gpm, this well would potentially produce 25,920 gallons per day. As noted in the well completion report, this capacity may not be representative of this well’s long-term yield. Additional drawdown and recovery testing would be necessary to estimate a sustainable long-term yield of the site well.

Louis Peek, Well WCR2017-006002, Project No: 0492.00

Page 4

This subject well does not appear to be hydrologically connected to, or capable of influencing surface water flows in Coon Creek or Hooker Creek. Nor does this well appear likely to be hydrologically connected to any local springs or ephemeral wetlands. Given the horizontal distances involved, and the elevation differences between the subject well, and the surface waters of the nearest watercourses, springs, and wetlands, the potential for significant hydrologic connectivity between surface water and groundwater in the Franciscan aquifer(s) appears unlikely.

There are two springs mapped in Section 23 on the USGS Miranda topographic quadrangle map; both springs are south of the subject well on the south facing slopes of Bear Buttes in the Hooker Creek watershed. The nearest mapped spring is over 2,000 feet south, in the southwest quarter of Section 23 at an elevation of approximately 1,550 feet. The second nearest spring is more than 4,000 feet southeast, in the southeast quarter of Section 23 at an elevation of approximately 1,440 feet. There are also springs mapped in Section 14, Section 26, and 27, but these are all more than a mile from the subject well. There are no other significant (mapped) springs or wetlands in the vicinity of this subject well.

We researched the California Department of Water Resources' database to find permitted wells within 1,000 feet of the subject well. Based on the information available at the present time, there are no wells that meet that criterion.

As groundwater mimics topography and responds to the force of gravity, in general any near surface unconfined aquifer will flow down slope in a direction subparallel to topography. The ground surface onsite slopes primarily to the northwest; thus, the near surface unconfined aquifer flows to the northwest, toward Coon Creek. This well did have a pump installed.

In our professional opinion, it appears that the aquifer tapped by the subject well is recharged by water infiltrating through the soil and Mélange bedrock from upslope source areas both proximal and distal to the well site. Ephemeral drainage courses in the vicinity also contribute recharge when they flow during runoff generating storm events.

The United States Department of Agriculture's (USDA), Natural Resources Conservation Service's (NRCS), online Web Soil Survey, shows the subject well within soils of the Sproulish-Canoecreek-Redwohly complex, on slopes of 15 to 30 percent, (#573, Figure 7), which the NRCS describes as a well-drained soil. The Web Soil Survey's unit description is attached to this report. Mean annual precipitation is listed by the NRCS as 60 to 100 inches per year. Capacity of the most limiting soil layer to transmit water (Ksat) is described as moderately high to high (0.20 to 2.00 in/hr) with a depth to the water table of greater than 80 inches.

If during the wet season, only ten percent of the "low end" precipitation estimation of 60 inches is absorbed by the soils/bedrock and does not flow across the ground surface and into local watercourses (or be lost to evapotranspiration), then approximately 63 acre-feet, or more than 20 million gallons of water per year (MGPY), may be expected to recharge the local aquifers below

Page 5

this 126-acre subject property. Given the same amount of precipitation (60”) and the same 10 percent partitioned to recharge, then within a 1,000-foot radius of the subject well, recharge can be estimated. Recharge within the 72 acres enclosed by a circle having a 1,000-foot radius, would be 36 acre-feet, and more than 11.7 MGPY. Our estimates are conservative; United States Geological Survey (USGS) researchers estimate that in northwest California, approximately 33 percent of precipitation goes to recharge (Flint, et al., 2103). If 33 percent of 60 inches, is partitioned to recall, then 210 acre-feet, or more than 68 MGPY recharge the local aquifer below the subject property.

On March 28, 2022, Governor Newsom issued an executive order (N-7-22) relating to the ongoing drought in California. In executive order N-7-22, the governor outlined measures the state will undertake to avoid and ameliorate the negative impacts of the current drought. Among these measures, it was ordered that counties, cities, and other public agencies have been prohibited from approving permits for new groundwater wells (or alteration of existing wells) in basins “*subject to the Sustainable Groundwater Management Act and classified as medium- or high-priority without first obtaining written verification from a Groundwater Sustainability Agency managing the basin or area of the basin where the well is proposed*”. This well on French Road, near Bear Buttes and Miranda, is not within a basin subject to the Act, and there has been no Groundwater Sustainability Agency established with authority over the area where this permitted well is sited.

The Governor’s order states that counties, cities, and other public agencies are prohibited from issuing permits for new groundwater wells (or altering existing wells) “*without first determining that extraction of groundwater from the proposed well is (1) not likely to interfere with the production and functioning of existing nearby wells, and (2) not likely to cause subsidence that would adversely impact or damage nearby infrastructure*”. The conditions in the Order are not applicable to “*wells that provide less than two acre-feet per year of groundwater for individual domestic users, or that will exclusively provide groundwater to public water supply systems.*”

Based on our observations, research, and experience, it is our professional opinion that the well WCR2017-006002, located on French Road, on APN 214-233-008, has a low likelihood of being hydrologically connected to nearby surface waters or neighboring wells in any manner that might significantly have a negative impact or effect on proximal wetlands, wells, and or surface waters.

Please contact us if you have questions or concerns regarding our findings and conclusions.

Sincerely,

David N. Lindberg, CEG

Lindberg Geologic Consulting	Engineering-Geologic Well Connectivity Assessment Report	Figure 6
Post Office Box 306	French Road, Miranda, California, APN: 214-233-008	December 12, 2022
Cutten, CA 95534	Well WCR2017-006002, Mr. Louis Peek, Client	Project 0492.00
(707) 442-6000	Hydrogeologic Cross Section (locations approximate)	VE = 2x

In this vertically exaggerated (~2x) cross section, the view is looking northwest and downslope to the north toward Coon Creek. Groundwater flow in this cross section is away from the viewer, or into the page. Groundwater is presumed to flow from recharge areas in the higher ground to the southeast, to the northwest toward Coon Creek. Bedrock subgrade is mapped by McLaughlin et al. (2000) as composed of Mélange (cm1) of the Franciscan Complex. Mélange is one of several components of the Central Belt Franciscan Complex. Groundwater is envisioned as flowing through fractured zones in metasediments. Fractures are interpreted to be the primary permeability providing preferential flow paths for groundwater in this area.

Annular Material

Depth from Surface Feet to Feet	Fill	Fill Type Details	Filter Pack Size	Description
0 20	Bentonite	Other Bentonite		Sanitary Seal

Other Observations:

Humboldt County, South Part, California

573—Sproulish-Canoecreek-Redwohly complex, 15 to 30 percent slopes, warm

Map Unit Setting

National map unit symbol: 1v5w1

Elevation: 100 to 3,280 feet

Mean annual precipitation: 60 to 100 inches

Mean annual air temperature: 48 to 57 degrees F

Frost-free period: 240 to 300 days

Farmland classification: Not prime farmland

Map Unit Composition

Sproulish, warm, and similar soils: 45 percent

Redwohly, warm, and similar soils: 20 percent

Canoecreek, warm, and similar soils: 20 percent

Minor components: 15 percent

Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Sproulish, Warm

Setting

Landform: Ridges, mountain slopes

Landform position (two-dimensional): Summit, shoulder, backslope

Landform position (three-dimensional): Mountaintop, mountainflank

Down-slope shape: Convex, linear

Across-slope shape: Linear

Parent material: Colluvium derived from mudstone and/or colluvium derived from sandstone and/or residuum weathered from mudstone and/or residuum weathered from sandstone

Typical profile

Oi - 0 to 1 inches: slightly decomposed plant material

A1 - 1 to 6 inches: loam

A2 - 6 to 11 inches: loam

Bt1 - 11 to 24 inches: paragravelly silty clay loam

Bt2 - 24 to 47 inches: very paragravelly clay loam

BCt - 47 to 63 inches: very paragravelly loam

Properties and qualities

Slope: 15 to 30 percent

Depth to restrictive feature: More than 80 inches

Drainage class: Well drained

Capacity of the most limiting layer to transmit water

(Ksat): Moderately high to high (0.20 to 2.00 in/hr)

Depth to water table: More than 80 inches

Frequency of flooding: None

Frequency of ponding: None

Maximum salinity: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)

Available water supply, 0 to 60 inches: Moderate (about 7.4 inches)

Interpretive groups

Land capability classification (irrigated): None specified

Land capability classification (nonirrigated): 4e

Hydrologic Soil Group: C

Ecological site: F004BJ101CA - Fog-influenced, low elevation slopes and footslopes

Hydric soil rating: No

Description of Canoecreek, Warm

Setting

Landform: Mountain slopes, ridges

Landform position (two-dimensional): Backslope, shoulder, summit

Landform position (three-dimensional): Mountainflank, mountaintop

Down-slope shape: Convex

Across-slope shape: Linear

Parent material: Colluvium and residuum derived from sandstone, mudstone, and conglomerate

Typical profile

Oi - 0 to 1 inches: slightly decomposed plant material

A - 1 to 6 inches: gravelly loam

AB - 6 to 19 inches: very gravelly loam

Bt1 - 19 to 31 inches: very gravelly loam

Bt2 - 31 to 41 inches: very gravelly sandy clay loam

Bt3 - 41 to 63 inches: very gravelly loam

Properties and qualities

Slope: 15 to 30 percent

Surface area covered with cobbles, stones or boulders: 1.0 percent

Depth to restrictive feature: More than 80 inches

Drainage class: Well drained

Capacity of the most limiting layer to transmit water

(Ksat): Moderately high to high (0.60 to 2.00 in/hr)

Depth to water table: More than 80 inches

Frequency of flooding: None

Frequency of ponding: None

Maximum salinity: Nonsaline to very slightly saline (0.0 to 2.0 mmhos/cm)

Available water supply, 0 to 60 inches: Moderate (about 6.6 inches)

Interpretive groups

Land capability classification (irrigated): None specified

Land capability classification (nonirrigated): 6e

Hydrologic Soil Group: B

Ecological site: F004BJ102CA - Dry, steep mountain slopes

Hydric soil rating: No

Description of Redwohly, Warm

Setting

Landform: Mountain slopes, ridges
Landform position (two-dimensional): Shoulder, backslope, summit
Landform position (three-dimensional): Mountaintop, mountainflank
Down-slope shape: Convex, linear
Across-slope shape: Convex, linear
Parent material: Residuum weathered from sandstone and/or
residuum weathered from mudstone

Typical profile

Oi - 0 to 1 inches: slightly decomposed plant material
A - 1 to 8 inches: paragravelly loam
Bt - 8 to 20 inches: paragravelly loam
BCt - 20 to 28 inches: paragravelly loam
C - 28 to 79 inches: paragravel

Properties and qualities

Slope: 15 to 30 percent
Depth to restrictive feature: 20 to 39 inches to strongly contrasting
textural stratification
Drainage class: Well drained
Capacity of the most limiting layer to transmit water
(Ksat): Moderately low to moderately high (0.14 to 1.42 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Maximum salinity: Nonsaline to very slightly saline (0.0 to 2.0
mmhos/cm)
Available water supply, 0 to 60 inches: Low (about 4.4 inches)

Interpretive groups

Land capability classification (irrigated): None specified
Land capability classification (nonirrigated): 6e
Hydrologic Soil Group: B
Ecological site: F004BJ101CA - Fog-influenced, low elevation
slopes and footslopes
Hydric soil rating: No

Minor Components

Briceland

Percent of map unit: 5 percent
Landform: Mountain slopes
Landform position (two-dimensional): Backslope
Down-slope shape: Concave
Across-slope shape: Linear
Hydric soil rating: No

Caperidge, warm

Percent of map unit: 5 percent
Landform: Ridges

Landform position (two-dimensional): Shoulder, summit
Landform position (three-dimensional): Mountaintop
Down-slope shape: Convex, linear
Across-slope shape: Linear, convex
Hydric soil rating: No

Kingrange

Percent of map unit: 3 percent
Landform: Mountain slopes
Landform position (two-dimensional): Shoulder
Landform position (three-dimensional): Mountainflank
Down-slope shape: Convex
Across-slope shape: Convex
Hydric soil rating: No

Rock outcrop

Percent of map unit: 2 percent
Landform: Mountain slopes
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Center third of
mountainflank
Down-slope shape: Convex
Across-slope shape: Convex
Hydric soil rating: No

Data Source Information

Soil Survey Area: Humboldt County, South Part, California
Survey Area Data: Version 12, Sep 2, 2022
