SUSPENDED CEILING NOTES:

1. 12 gauge (8 ga at gyp. bd.) hanger wires may be used for up to and including 4'-0" x 4'-0" grid spacing along main runners. Splices will not be permitted in any hanger wires. See (4)
2. Provide 12 ga. (8 ga at gyp. bd.) hanger wires at the ends of all main and cross runners within 8" from the support or within 1/4 of the length of the end tee, whichever is least, for the perimeter of the ceiling area. End connections for runners which are designed and detailed to resist the applied horizontal forces may be used in lieu of the 12 ga. hanger wires subject to agency review and approval.
3. Provide trapeze or other supplementary support members at obstructions to main hanger spacing. Provide additional hangers, struts or braces as required at all ceiling breaks, soffits or discontinuous areas. Hanger wires that are more than 1 in 6 out of plumb wall shall have counter-sloping wires.
4. Ceiling grid members may be attached to not more than 2 adjacent walls. Ceiling grid members should be at least 1/2 inch free of other walls, If walls run diagonally to ceiling grid system runners, one end of main and cross runners should be free and a minimum of 1/2" clear of wall. See (5/6)
5. At the perimeter of the ceiling area where main or cross runners are not connected to the adjacent wall, provide interconnection between the runners at the free end to prevent lateral spreading. A metal strut or 16 ga. wire with a positive mechanical connection to the runner may be used. Where the perpendicular distance from the wall to the first parallel runner is 12" or less, this interlock is not required. See (7)
6. Provide sets of four 12 ga. splayed bracing wires oriented 90 degrees from each other at not more than 12 feet by 12 feet on center. Provide bracing wires at locations not more than 1/2 of the above spacings from each perimeter wall and at the edge of vertical ceiling offsets. The slope of these wires should not exceed 45 degrees from the plane of the ceiling and should be taut without causing the ceiling to lift. Splices in bracing wires are not to be permitted. See (7) (10)
7. Fasten hanger wires with not less than 3 tight turns. Fasten bracing splay wires with 4 tight turns. Make all tight turns within a distance of 1-1/2 inches. Hanger or bracing wire anchors to the structure should be installed in such a manner that the direction of the wire aligns as closely as possible with the direction of the forces acting on the wire.
8. Separate all ceiling hanging and bracing wires at least 6 inches from all unbraced ducts, pipes, conduit, etc. It is acceptable to attach lightweight items, such as single electrical conduit not exceeding 3/4" nominal diameter, to hanger wires using connectors acceptable to U.B.C..
9. Attach all light fixtures to the ceiling grid runners to resist a horizontal force equal the weight of the fixtures.
10. Flush or recessed light fixtures and air terminals or services weighing less than 56 pounds may be supported directly on the runners of heavy duty grid system but, in addition, they must have a minimum of two 12 ga. slack safety wires attached to the fixture at diagonal corners and anchored to the structure above.

    All flush or recessed light fixtures and air terminals or services weighing 56 pounds or more must be independently supported by not less than 4 taut 12 ga. wires each attached to the fixture and to the structure above regardless of the type of ceiling grid system used.

    The 4 taut 12 ga. wires including their attachment to the structure above must be capable of supporting 4 times the weight of the unit.
11. All fixtures and air terminals or services supported on intermediate duty grid systems must be independently supported by not less than 4 taut 12 ga. wires each attached to the fixture or terminal and to the structure above.
12. Support surface mounted light fixtures by at least two positive devices which surround the ceiling runner and which are each supported from the structure above by a 12 ga. wire. Spring clips or clamps that connect only to the runner are not acceptable. Provide additional supports when light fixtures are 8 feet or longer.
13. Support pendant mounted light fixtures directly from the structure above with hanger wires or cables passing through each pendant hanger and capable of supporting 4 times the weight of the fixture.
14. Lay-in ceiling assemblies in exitways shall be installed with a main runner or cross runner surrounding all sides of each piece of tile board or panel and each light fixture or grill splices and intersections of such runners shall be attached with through connectors such as pop rivets, screws, pins, plates with bent tabs or by other approved connectors. Expansion joints shall be provided in the ceiling at intersections of corridors and at junctions of corridors and lobbies or other similar areas.
15. Gypboard suspended ceiling systems shall comply with Title 24, CCR, and gypboard ceilings should not support materials or building components other than grills, light fixtures, small electrical conduits, small ducts and the like. All such components should be supported either directly from main runners, or by supplemental framing which is supported by main runners.
16. Suspended acoustical ceiling systems shall comply with 2016 CBC (2015 IBC), ASTM C635, ASTM C636, CISCA (FOR SEISMIC ZONES 3 & 4), AND ASCE 7.05. No vertical loads other than gypboard dead load should be applied to cross-furring.

Test Performed By:

Designer:
This compliance document is to be used by the designer and attached to the plans. Listed below are all the acceptance tests for HVAC systems. The designer is required to check the applicable boxes for all acceptance tests that apply and list all equipment that requires an acceptance test. All equipment of the same type that requires a test, list the equipment description and the number of systems.

Installing Contractor:
The contractor who installed the equipment is responsible to either conduct the acceptance test themselves or have a qualified entity run the test for them. If more than one person has responsibility for the acceptance testing, each person shall sign and submit the Certificate of Acceptance applicable to the portion of the construction or installation for which they are responsible.

Enforcement Agency:
Plancheck - The NRCC-MCH-01-E compliance document is not considered a completed document and is not to be accepted by the building department unless the correct boxes are checked.
Inspector - Before occupancy permit is granted all newly installed process systems must be tested to ensure proper operations.

A. Mechanical Ventilation and Reheat

In lieu of this compliance document, the required outdoor ventilation rates and airflows may be shown on the plans or the calculations can be presented in a spreadsheet. Mechanical Ventilation and Reheat worksheet available on the Energy Commission's website at: http://www.energy.ca.gov/title24/2016standards/.
Note: In all of the calculations that compare a supply quantity to the REQ'D V.A. quantity, the actual percentage of outdoor air in the supply is ignored.
Areas in buildings for which natural ventilation is used should be clearly designated. Specifications must require that building operating instructions include explanations of the natural ventilation system.

REHEAT VAV CONTROL DIAGRAM

VAV BOX COOLING AND HEATING:
UNLESS OTHERWISE NOTED, ALL SETPOINTS AND TIME DELAYS SHALL BE ADJUSTABLE THROUGH THE BAS.

RUN CONDITIONS – SCHEDULED:
THE UNIT SHALL RUN ACCORDING TO A USER DEFINABLE TIME SCHEDULE IN THE FOLLOWING MODES:
- OCCUPIED MODE: THE UNIT SHALL MAINTAIN A 75°F (ADJ.) COOLING SETPOINT, A 70°F (ADJ.) HEATING SETPOINT AND A DEADBAND OF 5°F BETWEEN COOLING AND HEATING.
- UNOCCUPIED MODE (NIGHT SETBACK): THE UNIT SHALL MAINTAIN AN 85°F COOLING SETPOINT AND A 55°F HEATING SETPOINT.

ALARMS SHALL BE PROVIDED AS FOLLOWS:
- HIGH ZONE TEMP: IF THE ZONE TEMPERATURE IS GREATER THAN THE COOLING SETPOINT BY 10°F.
- LOW ZONE TEMP: IF THE ZONE TEMPERATURE IS LESS THAN THE HEATING SETPOINT BY 10°F.

TIME OF DAY SCHEDULE:
OCCUPIED MODE SHALL BE INITIATED UPON A START REQUEST FROM A VAV BOX.

MINIMUM VENTILATION ON CARBON DIOXIDE (CO2) CONCENTRATION (WHERE NOTED ON DRAWINGS):
WHEN IN THE OCCUPIED MODE, THE CONTROLLER SHALL MEASURE THE ZONE CO2 LEVELS AND MODULATE THE ZONE DAMPER OPEN ON RISING CO2 CONCENTRATIONS, OVERRIDING NORMAL DAMPER OPERATION TO MAINTAIN A CO2 SETPOINT OF NO MORE THAN 1,000 PPM. THE ZONE AIRFLOW SHALL NOT EXCEED THE DESIGN COOLING MAXIMUM AIRFLOW SETPOINT. TO PREVENT OVERCOOLING THE ZONE, THE CONTROLLER SHALL MODULATE THE REHEAT VALVE TO MAINTAIN THE ZONE HEATING SETPOINT.

ALARMS SHALL BE PROVIDED AS FOLLOWS:
- HIGH ZONE CARBON DIOXIDE CONCENTRATION: IF THE ZONE CO2 CONCENTRATION IS GREATER THAN 1,200 PPM FOR MORE THAN 20 MINUTES.

THE OCCUPANT SHALL BE ABLE TO ADJUST THE ZONE TEMPERATURE HEATING AND COOLING SETPOINTS AT THE ZONE SENSOR. THE RANGE OF ADJUSTMENT SHALL BE +/– 2°F.

ZONE UNOCCUPIED OVERRIDE:
A TIMED LOCAL OVERRIDE CONTROL SHALL ALLOW AN OCCUPANT TO OVERRIDE THE SCHEDULE AND PLACE THE UNIT INTO AN OCCUPIED MODE FOR A 60 MINUTE PERIOD OF TIME. AT THE EXPIRATION OF THIS TIME, CONTROL OF THE UNIT SHALL AUTOMATICALLY RETURN TO THE SCHEDULE.

VARIABLE VOLUME TERMINAL UNIT – AIR FLOW CONTROL:
THE UNIT SHALL MAINTAIN ZONE SETPOINTS BY CONTROLLING THE AIRFLOW THROUGH ONE OF THE FOLLOWING:
- WHEN ZONE TEMPERATURE IS GREATER THAN ITS COOLING SETPOINT, THE ZONE DAMPER SHALL MODULATE BETWEEN THE MINIMUM AIRFLOW AND THE MAXIMUM AIRFLOW UNTIL THE ZONE IS SATISFIED.
- WHEN THE ZONE TEMPERATURE IS BETWEEN THE COOLING SETPOINT AND THE HEATING SETPOINT, THE ZONE DAMPER SHALL MAINTAIN THE MINIMUM AIRFLOW.

- STAGE 1: FOR A HEATING LOOP SIGNAL FROM 0% TO 50%, THE MINIMUM AIRFLOW SHALL BE MAINTAINED AND THE REHEAT VALVE SHALL MODULATE TO SATISFY THE ZONE SETPOINT UNTIL A MAXIMUM VAV BOX DISCHARGE AIR TEMPERATURE OF 95°F IS REACHED.
- STAGE 2: FOR A HEATING LOOP SIGNAL FROM 51% TO 100%, THE REHEAT VALVE SHALL MODULATE TO MAINTAIN THE VAV BOX DISCHARGE AIR TEMPERATURE PER THE VAV SCHEDULE OR 95°F MAX WHILE THE ZONE DAMPER MODULATES BETWEEN THE MINIMUM AIRFLOW AND THE HEATING MAXIMUM AIRFLOW UNTIL THE ZONE IS SATISFIED.

SUPPLY AIR TEMPERATURE MONITORING:
THE CONTROLLER SHALL MONITOR THE DISCHARGE AIR TEMPERATURE.
ALARMS SHALL BE PROVIDED AS FOLLOWS:
- HIGH SUPPLY AIR TEMP: IF THE DISCHARGE AIR TEMPERATURE IS GREATER THAN 105°F IN HEATING.
